## About this talk

- A talk of questions, not of answers
- A biased summary
- Stimulate discussion
- $\Rightarrow$  Please interrupt me if . . .
  - ... you have a question
  - ... you have a suggestion
  - ... you have no clue why one would possibly do this

High-throughput screening

Incertainty quantification and model error

#### Contents

- 2 Density-functional theory
- 3 Error estimation in DFT
- Uncertainty quantification and model error

## Societal challenges of 21st century

- Renewable energy
- Green chemistry and catalysts
- Drug design
- Transportation
- Data storage and communication
- $\Rightarrow$  Need for novel materials
- $\Rightarrow$  High-throughput computational screening

## High-throughput screening: Approach

- Given: Design space of novel materials
- Aim: Optimise wrt. target descriptors:
  - Solve physical model for material
  - Omputed derived properties
- Computational approaches / fidelities:
  - Empirical models (Statistical surrogates, coarse-graining)
  - Density-functional theory (DFT)
  - Post-DFT methods (GW, ...)
- Statistical learning:
  - Still needs (lots of) high-level samples

High-throughput ○○○●○	Density-functional theory	Error estimation in DFT 0000	UQ and high-throughput
Typical scale			

- $\bullet$  One DFT calculation:  $\mathcal{O}(\text{hours})$  to  $\mathcal{O}(\text{days})$
- E.g. Open Catalyst Project<sup>1</sup>
  - $\bullet~1.3$  million DFT calculations
  - $\bullet\ > 250$  million DFT energy evaluations
  - Workflow success rate:  $\simeq 50\%^2$
- $\Rightarrow$  Reliability needs to be improved!
- $\Rightarrow$  Need for careful understanding of errors
- $\Rightarrow$  How much effort is really needed?
  - Multidisciplinary research problem

<sup>&</sup>lt;sup>1</sup>L. Chanussot et. al. The Open Catalyst 2020 (OC20) Dataset, 2020, arXiv 2010.09990.

<sup>&</sup>lt;sup>2</sup>Z. Ulissi, private communication in ARPAE differentiate group seminar, Dec 2020.

Density-functional theory 000000

Error estimation in DFT 0000

UQ and high-throughput

# Density-functional toolkit (DFTK)<sup>1</sup>

- https://dftk.org
- 2 years of development
- Pure julia code
- Supports mathematical developments and scale-up to regime relevant to applications
- Low entrance barrier: Only 6k lines of code!
- International and interdisciplinary user base:
  - Analysis, mathematical physics, applications, ...

<sup>1</sup>M. F. Herbst, A. Levitt and E. Cancès. JuliaCon Proc., **3**, 69 (2021).

UQ and high-throughput

## The essence of density-functional theory

$$\gamma_0 = \operatorname*{arg\,min}_{\gamma \in \mathcal{P}_N} \frac{\mathcal{E}_{\mathsf{DFT}}(\gamma)}{\mathcal{E}_{\mathsf{DFT}}(\gamma)}$$

Energy functional

$$\begin{split} \mathcal{E}_{\mathsf{DFT}}(\gamma) &= \operatorname{tr}_{L^2}\left(-\frac{1}{2}\Delta\gamma\right) + \int \rho_{\gamma}(\underline{r}) V_{\mathsf{ext}}(\underline{r}) \,\mathrm{d}\underline{r} \\ &+ \frac{1}{2}\int \rho_{\gamma}(\underline{r}) v_C(\underline{r},\underline{r}') \rho_{\gamma}(\underline{r}') \,\mathrm{d}\underline{r} \,\mathrm{d}\underline{r}' + E_{\mathsf{xc}}(\rho_{\gamma}) \end{split}$$

- Density matrix  $\gamma \in \mathcal{P}_N$ ,  $0 \leq \gamma \leq 1$ ,  $\operatorname{tr}_{L^2}(\gamma) = N$
- Density  $\rho_{\gamma}(\underline{r}) = \gamma(\underline{r}, \underline{r})$
- Coulomb kernel  $v_C(\underline{r},\underline{r}') = \|\underline{r} \underline{r}'\|^{-1}$
- Exchange-correlation energy  $E_{\rm xc}(\rho_{\gamma})$
- External potential  $V_{\text{ext}}$

High-throughput 00000	Density-functional theory	Error estimation in DFT 0000	UQ and high-throughput

#### Euler-Lagrange equation

• Coupled set of non-linear elliptic partial differential equations:

$$\left( -\frac{1}{2}\Delta + \mathcal{V}(\rho) \right) \psi_i = \varepsilon_i \psi_i, \quad \int \psi_i^* \psi_j = \delta_{ij}$$

$$\rho = \sum_{i=1}^{\infty} f\left( \frac{\varepsilon_i - \varepsilon_F}{T} \right) |\psi_i|^2, \quad \text{with } \varepsilon_F \text{ such that } \int \rho = N$$

• Density-dependent potential

$$\mathcal{V}(\rho) = V_{\text{ext}} + \int (v_C \rho) + V_{\text{xc}}(\rho)$$

with Coulomb kernel  $v_C(\underline{r},\underline{r}') = \|\underline{r} - \underline{r}'\|^{-1}$ 

- Fermi-Dirac function  $f(x) = 1/(1 + e^x)$
- Temperature T, electron count N

• Exchange-correlation potential  $V_{xc} = \frac{\mathrm{d}E_{xc}(\rho)}{\mathrm{d}\rho}$ 

#### Self-consistent field (SCF) as a fixed-point problem

Density-dependent potential

$$\mathcal{V}(\rho) = V_{\text{ext}} + \int (v_C \rho) + V_{\text{xc}}(\rho)$$

 $\bullet\,$  Potential-to-density map F

$$F(V) = \sum_{i=1}^{\infty} f\left(\frac{\varepsilon_i - \varepsilon_F}{T}\right) |\psi_i|^2$$

with  $(\varepsilon_i, \psi_i)$  eigenpairs of  $-\frac{1}{2}\Delta + V$ .

- $\Rightarrow \text{ SCF solves } \rho = F(\mathcal{V}(\rho))$ 
  - Numerically: Damped fixed-point scheme

$$\rho_{n+1} = \rho_n + \alpha P^{-1} \left[ F(\mathcal{V}(\rho_n)) - \rho_n \right]$$

with preconditioner ("mixing") P

High-throughput 00000	Density-functional theory ○○○○●○	Error estimation in DFT	UQ and high-throughput
DFT propert	ies and descriptor	S	

- Assume fixed-point problem solved:  $\rho^* = \arg \min_{\rho} \mathcal{E}_{\mathsf{DFT}}(\rho)$
- DFT properties:
  - Derivatives  $\frac{\mathrm{d}\mathcal{E}^{\lambda}_{\mathsf{DFT}}(\rho^{*})}{\mathrm{d}\lambda}$
  - $\lambda:$  Physical system-dependent parameter of  $V_{\rm ext}$
  - Examples: Forces, stresses, dipole moment, phonons, ...
  - Total derivative: Might require derivative of  $\rho(\lambda)$
- Descriptors to compute for screening:
  - DFT quantities:  $\mathcal{E}_{\mathsf{DFT}}$ ,  $\varepsilon_i$ , ... ( $\simeq$  stability)
  - DFT properties ( $\simeq$  usefulness)

- Nested iterative problem:
  - $\bullet\,$  Fixed point search, with diagonalisation for each iterate  $\rho_n$
- Multi-step procedure:
  - (Geometry optimisation)
  - Fixed-point problem
  - Properties
- Numerous modelling parameters:
  - Model parameters:  $E_{xc}$ ?
  - Numerical parameters:
  - Algorithmic parameters:
  - Arithmetic parameters:

Discretisation, T, ...

Tolerances, preconditioners, ...

Floating-point type, ...

2 Density-functional theory

## Perspective of error estimation in DFT

- Nowadays: Parameter selection by trial and error
- Sources of error in DFT:
  - Model error:  $\leftrightarrow E_{\mathsf{xc}}$
  - Numerical error:  $\leftrightarrow$  Discretisation , T, ...
  - Algorithmic error:  $\leftrightarrow$  Tolerances, preconditioners, ...
  - Arithmetic error:  $\leftrightarrow$  Floating-point type, ...
- Robust error estimates:
  - $\bullet~$  Total error known  $\Rightarrow~$  Error bars
  - $\bullet~\mbox{Error-guided}$  adaptive numerics  $\Rightarrow~\mbox{Efficiency}$  gain
- Vision: Robust automatic selection of numerical parameters

- Reduced model: Non-self-consistent Kohn-Sham
- Estimation of full numerical error
- Discretisation + algorithm + arithmetic
- Extensions ongoing work ...

<sup>1</sup>M. F. Herbst, A. Levitt and E. Cancès. Faraday Discuss. 224, 227 (2020).

- Numerical error:
  - Discretisation + algorithm + arithmetic
  - Promising a posteriori error estimates emerging
  - But: Usually the smaller contribution to the total error
  - Reason: Calculations "over-converged"
  - $\Rightarrow$  Source for extra performance
- Model error (*E*<sub>xc</sub>):
  - Plethora of fidelity options (more in a sec)
  - A posteriori error estimates very challenging
  - $\Rightarrow$  Regime of UQ / statistical methods
  - ⇒ Answers: How much numerical accuracy needed?

#### Contents

Incertainty quantification and model error

## DFT model classes

- "Jacob's ladder" hierarchy for  $E_{xc}$ :
  - LDA, GGA, meta-GGA, Hybrid, RPA-like, ...
  - Each "step" defines parametrised model  $\mathcal{E}^{\alpha}_{\mathsf{DFT}}$
  - $\bullet\,$  Hundreds of members differing by  $\alpha$
  - Found by fitting and/or from physics
  - $\bullet\,$  Parameter space increases  $\simeq\,$  models get more accurate
- Additional correction terms (+U, dispersion, counterpoise, ...)
- DFT is a *non-variational* approximation to exact physics
- $\Rightarrow$  No strictly guaranteed ranking

## Quantifying model uncertainty

- Error measures: Mean error, mean absolute error, relative error
- Conclusions depend on error measure<sup>1</sup>
- Best: Problem-specific error measure (e.g.  $\Delta$ -test)
- But: Hardly any specific ones developed
- Predominant generic approach: Regression-based methods<sup>2</sup>
- $\Rightarrow$  Not predictive

<sup>&</sup>lt;sup>1</sup>B. Civalleri, D. Presti, R. Dovesi, A. Savin, *On choosing the best density functional approximation*, in: Chemical Modelling: Applications and Theory, 168 (2012).

<sup>&</sup>lt;sup>2</sup>K. Lejaeghere. *The uncertainty pyramid for electronic-structure methods*, 41. Elsevier (2020).

### The need for predictive UQ

- Screening decisions: Comparison with best case
- I.e. both best case and design space are simulated
- Then descriptors compared
- Model uncertainty usually neglected
- $\Rightarrow$  Errors in differences can be large
- $\Rightarrow$  Without UQ: Comparison of simulations can be misleading<sup>1</sup>

<sup>&</sup>lt;sup>1</sup>G. Houchins, D. Krishnamurthy and V. Viswanathan. MRS Bull., 44, 204 (2019).

## BEEF: Predictive UQ for the model error<sup>1</sup>

- BEEF: Bayesian Error Estimation Functional
- Based on ideas from Bayesian statistics
- BEEF approach:
  - Given some observations of a quantity q (e.g. experiment)
  - $\bullet\,$  Find "best" choice for  $\alpha$  on a "step" by fit
  - $\bullet$  Additionally: Distribution  $P(\alpha)$  constructed
  - Aim: Ensemble spread of  $\mathcal{E}^{\alpha}_{\mathsf{DFT}}$  represents model error
- Challenges for construction:
  - No model class is exact
  - Approximation known to not contain exact result

<sup>&</sup>lt;sup>1</sup>R. Christensen, T. Bligaard and K. W. Jacobsen. *Bayesian error estimation in density functional theory*, 77-91. Elsevier (2020).

High-throughput 00000	Density-functional theory	Error estimation in DFT 0000	UQ and high-throughput
BEEF: Key	idea <sup>1</sup>		

- Consider N observations  $q_i$ , model predictions  $q_i(\alpha)$ , least-squares cost  $C(\alpha) = \sum_i (q_i q_i(\alpha))^2$
- Assume we found  $\alpha^* = \arg\min_\alpha C(\alpha)$
- For a model  $\mathcal{E}_{\mathsf{DFT}}^{\alpha}$  define

• Error 
$$\Delta q_i = q_i - q_i(\alpha)$$

- Model deviation  $\delta q_i(\alpha) = q_i(\alpha) q_i(\alpha^*)$
- Goal: Spread on  $P(\alpha)$  should be model deviation (on average)

$$\sum_{i} \int \left[ \delta q_i(\alpha) \right]^2 P(\alpha) \, \mathrm{d}\alpha = \sum_{i} (\Delta q_i)$$

• By maximum entropy principle (introduce least bias):

$$P(\alpha) \propto \exp\left(-\frac{NC(\alpha)}{2C(\alpha^*)}\right).$$

<sup>&</sup>lt;sup>1</sup>V. Petzold, T. Bligaard and K. W. Jacobsen. Top. Catal., 55, 402 (2012).

## **BEEF**: Usage in practice

- q typically an energy difference quantity
  - E.g. Formation energy:  $\mathcal{E}_{DET}^{\text{compound}} \mathcal{E}_{DET}^{\text{atoms}}$
- Offline: Determine  $\alpha^*$ 
  - Pick one DFT model class
  - Fit against data  $q_i$
- Solve DFT:  $\rho^* = \arg \min_{\rho} \frac{\mathcal{E}_{\mathsf{DFT}}^{\alpha^*}(\rho)}{\mathcal{E}_{\mathsf{DFT}}^{\alpha^*}(\rho)}, \ \mathcal{E}^* = \frac{\mathcal{E}_{\mathsf{DFT}}^{\alpha^*}(\rho^*)}{\mathcal{E}_{\mathsf{DFT}}^{\alpha^*}(\rho^*)}$
- Sample  $\tilde{\alpha}$  from P:
  - One-shot computation:  $\mathcal{E}_{\mathsf{DFT}}^{\tilde{\alpha}}(\rho^*)$  (same  $\rho^*$ , different  $\alpha$ )
  - Resulting energy distribution: Uncertainty estimate
- Propagate distribution forward to quantity of interest q'

## BEEF: Issues and open questions

- BEEF-based approaches termed uncertainty quantification
- Issues:
  - $\bullet~$  Sensitivity of model parameters  $\neq~ error~ to~ experiment$
  - Experimental error ignored (just regularisation)
  - Self-consistency not treated
  - Limitation to energies (and derivatives)
- Open questions:
  - Rigid mathematical justification for this framework?
  - Usually q' = q, but not always: Is error propagation valid?
  - What if numerics is not perfect? Experimental error?

## Multi-fidelity approaches

- Natural approach for design-space searches:
  - Far from optimum: Full accuracy not needed
- Possible axes of fidelity:
  - Discretisation parameters (some related, some not)
  - DFT models
- Initial developments<sup>1,2</sup>
  - Two a priori defined fidelity layers
  - Co-kriging, Gaussian process regression approaches
  - Two models or two accuracies

<sup>&</sup>lt;sup>1</sup>G. Pilania, J. Gubernatis and T. Lookman. Comput. Mater. Sci., **129**, 156 (2017). <sup>2</sup>R. Batra, G. Pilania, B. P. Uberuaga et al. ACS Appl. Mater. Interfaces, **11**, 24906 (2019).

## Multi-fidelity: Open questions and challenges

- Which approach?
  - Kriging, Bayesian optimisation, ...
- Design space  $\leftrightarrow$  feature space for learning
- Experimental design and sampling strategy?
  - ... in feature space
  - ... in design space
- Adaptive definition of numerical fidelity layers?
- DFT models: No strict ordering of improvement
  - At best empirically for selected classes of materials
- Selection of good features

UQ and high-throughput

### Opportunities for UQ: Uses of DFT data

- ✓ Design-space searches
- Potential fitting
  - For molecular dynamics
  - Propagation of DFT error / fitting error?
- Geometry optimisation
  - Sensitivity of DFT model?

00000	000000	0000	

## Summary

https://michael-herbst.com/talks/2021.06.01\_dft\_uq.pdf

- Density-functional theory:
  - Key method for high-throughput materials discovery
  - Nested iterative procedures
  - Sizable number of numerical parameters: Reliability issue
- Error estimation in DFT:
  - A posteriori error estimation: Numerical error
  - Model error estimation  $\Rightarrow$  UQ research needed
- Perspectives and efficiency gains by better UQ:
  - $\bullet~\mbox{Error}$  balancing model  $\leftrightarrow~\mbox{numerics}$
  - Multi-fidelity design-space searches
  - Error propagation beyond energy quantities

High-throughput 00000	Density-functional theory	Error estimation in DFT 0000	UQ and high-throughput ○○○○○○○○○○○●
